

TECHNICAL EXERCISES

Solve the exercises contained in each of the provided tests.

Create a git repository where the solutions of each of the tests will be versioned.

Platforms such as Github, GitLab and BitBucket can be used to host the repository.

The initial commit will contain 3 empty folders named SQL, Java and Javascript.

Then, for each test exercise, a branch will be created starting from master where the solution to it will be placed in the corresponding folder and then a merge with master will be made so that this branch contains the final version of the changes.
